Introduction

MESPEUS is a freely accessible database which uses carefully selected metal coordination groups found in metalloprotein structures taken from the Protein Data Bank. The database contains geometrical information of metal sites within proteins. Metal types include Metals selected are the 10 elements common in biology, known as Na, Mg, K, Ca, Mn, Fe, Co, Ni, Cu, and Zn. Additional 30 metals are also covered, including Ag, Al, Au, Ba, Be, Cd, Cr, Cs, Ga, Gd, Hg, Ir, Li, Mo, Pb, Pd, Pr, Pt, Rb, Re, Rh, Ru, Sr, Tb, Tl, U, V, W, Y, and Yb. In order to completely determine the metal coordination, the symmetry-related units of a given protein structure are taken into and are generated using the appropriate space group symmetry operations. MESPEUS is automatically updated monthly by synchronizing with the Protein Data Bank database. MESPEUS is now available at <http://mespeus.nchu.edu.tw/>.

Major Features

1. Both **x-ray** and **cryoEM** models are included in the collection of MESPEUS.
2. Covering **40 metals**: selected are the 10 elements common in biology, known as Na, Mg, K, Ca, Mn, Fe, Co, Ni, Cu, and Zn. Additional 30 metals are also covered, including Ag, Al, Au, Ba, Be, Cd, Cr, Cs, Ga, Gd, Hg, Ir, Li, Mo, Pb, Pd, Pr, Pt, Rb, Re, Rh, Ru, Sr, Tb, Tl, U, V, W, Y, and Yb.
3. In order to completely determine the metal coordination, the **symmetry-related units** of a given protein structure are taken into and are generated using the appropriate space group symmetry operations. This allows a more complete description of the metal coordination geometry by including coordinating atoms that are not in the asymmetric unit.
4. The idea of a '**target distance**' has been applied to the recognition coordination donors which are the most likely distances found from previous studies between the metal of interest and various ligand atoms.
5. The MESPEUS system has been developed to be capable of **automatically updating** its database monthly by synchronizing its data with the storage of Protein Data Bank database and performing metal site analysis as well as content renewal.
6. The database is **freely accessible** and open to all users without login requirement.

Interface operation

Main query page of the MESPEUS web interface. Two methods proceed query:

1. By directly inputting a PDB ID to investigate all of the metal sites in a protein structure.
2. By specifying a selection of query criteria to search for metal sites of interest.

MESPEUS SEARCH

Check PDB Code

Reset Search

1. Inputting a PDB ID

1.1 Users can investigate all of the metal sites in a proteins by simply inputting a PDB ID

The image shows a web interface for 'MESPEUS SEARCH'. A green button labeled 'Check PDB Code' is circled with a red '1'. Below it is a modal dialog box titled 'Check PDB Code' with a close button (X). Inside the dialog, there is a text input field labeled 'PDB Code' which is circled with a red '2'. At the bottom of the dialog are 'Cancel' and 'OK' buttons.

1. Click on the Check PDB Code button.

2. Input a PDB ID to investigate all of the metal sites in that protein.

1.2 Query results of giving a PDB ID

Results showing the metal sites in a metalloprotein (PDB ID: 6AAP).

The screenshot shows a 3D model of a protein structure with a metal site highlighted in red. The interface includes a control panel with buttons for 'Cartoon On', 'Gray', 'Translucent', 'Cell', 'Reset', 'Spin On', and 'Spin Off'. A table below the structure lists the metal site details.

No.	Metal Name (Coordination No.)	Donor Residue Name (Occupancy)	Distance	B Value (Metal / Donor)
1	MG 501 A (6)	O2G ATP A 504 (1.0)	2.056	19 / 18.7
		O2B ATP A 504 (1.0)	2.007	19 / 18.7
		O HOH A 640 (1.0)	2.045	19 / 18
		O HOH A 682 (1.0)	2.190	19 / 22.6

- The structure model is displayed in 3D by JSmol with a series of interactive buttons to operate the model with ease. If the metal site(s) contains donor atoms from a symmetry-related unit(s), the model of the symmetry-related unit(s) will be displayed in translucent mode. Functions of the buttons are described as below:

Cartoon on	Display the structure model in cartoon mode.
Gray	Change the color to gray.
Translucent	Display the structure model in translucent mode.
Cell	Display the lattice cell.
Reset	Reset the rendering.
Spin On	Spin the structure model.
Spin Off	Stop spinning the structure model.

2. Information of the protein structure model derived from the PDB file.

PDB ID	Protein Data Bank Identification Number.
Title	The title of the protein structure.
Class	The classification or family of the protein.
Resolution	The structural resolution of the protein model.
Space Group	The space group of the protein model.
Cell	The information of the lattice cell.
Refinement Program	The program applied to the refinement process.
R Value	The R value of the structural model.
Free R	The R free of the structural model.
No. Metal Sites	The number of the metal sites found in the protein structure.

3. Information of Metal Site(s)

No.	Metal Name (Coordination No.)	Donor Residue Name (Occupancy)	Distance	B Value (Metal / Donor)

No.	The ID of the metal site found in the structure.
Metal Name (Coordination No.)	Information of the metal and its coordination number. The metal name, metal's residue ID and chain ID are displayed. It is clickable to interactively point out and centre the metal shown on the JSmol.
Donor Residue Name (Occupancy)	The information of the donor residue(s). The donor atom, residue name, chain ID, residue ID, and the occupancy value are displayed. It is clickable to open a page showing the details of the metal site, as described in Section 2.3 .
Distance	The observed metal-donor atom distance.
B Value (Metal/Donor)	The B value of the metal and donor.

2. Specify query criteria.

2.1 Specifying the query criteria.

The MESPEUS web interface allows users to submit a query through various search options for types of interactions observed in a metal site with a specific resolution.

2.2 Search result

Result page of searching for Mg-ATP interaction with the query criteria of metal = Mg, coordination number = Any, donor atom = Any, donor residue = ATP and maximum resolution = 2.5. Users can click on the question marks shown on the page to obtain the relevant information. The details of the page content are described as following sections.

1. New Search button : click on to perform a new search.
2. Amend Search button : click on to perform a amend search.
3. Showing the query criteria of present search.

A set of histograms will be generated to statistically illustrate the search result after a query. Apart from data visualisation, the histograms also function as filters to retrieve a subset from the search result by clicking on the bins. In addition, the curves shown on each histogram display the dynamically updated information. The curve reflects the distribution of the subset when users clicked on the bin of the histogram. The bins of the histograms are separated in order for users to inspect and click on them with ease. The histograms are provided with drilldown enabled function allowing users to examine query results to the desired level of detail. Information of the histograms can be downloaded as svg, png and csv formats. Details as below:

4. A histogram showing the distribution of metal-donor distances of the hit metal sites.
5. A histogram showing the distribution of structure resolution of the hit proteins.
6. A histogram showing the distribution of coordination number of the hit metal sites.
7. Downloading the histogram information in different file formats.

8. Pages showing the query results. Users can click on it to change the page.
9. Click on to download the query results in format of csv for further investigation locally.
10. An exclusion function is available for de-selecting the undesired entries before downloading or calculating distributions.

The columns of the query result table from the left side lists the metal-donor distances measured, coordination number, estimated shape with the RMSD value from the ideal geometry, metal name, donor group (atom name, residue name, chain ID and residue ID), PDB ID, resolution, the RMSD between the metal-donor atom distances and the target distances observed in the metal site and the difference between the two distances.

<input type="checkbox"/>	No.	Distance ↕	Coordination Number ↕	Shape ⓘ	Metal Name	Donor Residue Name	PDB	Reslu. ↕	r.m.s.d. (Å) ⓘ	Difference ↕
--------------------------	-----	------------	-----------------------	---------	------------	--------------------	-----	----------	----------------	--------------

No.	The IDs of the hit entries where user can click on the checkbox to select desired entries before downloading or calculating distributions.
Distance	The observed metal-donor distances (Å). A sorting function is available by clicking on the head of the column.
Coordination Number	The coordination number of a metal site. A sorting function is available by clicking on the head of the column.
Shape	The determined shape of the coordination group. Regardless of bond type, coordination numbers 4, 5 and 6 have regular shapes and interbond angles of a coordination group can be 1) a tetrahedral with equivalent bond angles at 109.5°, or a square planar with angles at 90°, 2) trigonal bipyramid or tetragonal pyramid, and 3) a octahedral with angles at 90°, respectively. A question mark on the head of the column can be clicked on to show the details of the shape determination.
Metal Name	The metal name of the coordination group, presenting the metal identity, residue ID and chain ID as shown in the PDB file. The entries are clickable to open another page to show the detail of the metal site.
Donor Residue Name	The identities of the donor residue, presenting the atom type, residue name, chain ID and residue number as shown in the PDB file.
PDB	The PDB ID of the metalloprotein. The entries are clickable to open another page to show the details of the metalloprotein. A sorting function is available by clicking on the head of the column.
Reslu.	The structural resolution of the metalloprotein model (Å). A sorting function is available by clicking on the head of the

	column.
r.m.s.d. (Å)	Metal "r.m.s.d." is the r.m.s. difference between metal-donor atom distances calculated from the PDB file coordinates, and the target distances. This is quite useful as a quality indicator for the reported distances and the geometry of the site. A question mark on the head of the column can be clicked on to show the details of the shape determination. A sorting function is available by clicking on the head of the column.
Difference	The difference between the the metal-donor atom distances and the target distances observed in the metal site. A sorting function is available by clicking on the head of the column.

11. Click to pop up a webpage with information of the selected metal site, detailed in [Section 2.3](#).

12. Click to pop up a webpage with information of the selected metalloprotein, detailed in [Section 1.2](#).

Metal Name	Donor Residue Name	PDB
11 MG 503 A	O1G ATP A 504	12 6AAP
MG 502 A	O1B ATP A 504	6AAP
MG 302 D	O1B ATP D 306	7RUT
MG 302 D	O1G ATP D 306	7RUT
MG 301 D	O1G ATP E 303	7RUT
MG 301 D	O2B ATP E 303	7RUT

2.3 Information of a metal site

Page displaying the specified metal site found in a protein (PDB ID: 6AAP). The buttons next to the graphs allow users to manipulate the 3D pictures with ease, such as to centre and rotate the view and to add other information. If the metal site(s) contains donor atoms from a symmetry-related unit(s), the model and the interacting donor(s) of the symmetry-related unit(s) will be displayed in translucent mode.

1. The coordination group of the metal site is shown in 3D by JSmol. Clicking on the “Donor Atom(s)” button can display the identities of the donor groups; “Angle(s)” to display the angles of donor-metal-donor combinations; “Distance(s)” for the distance between the metal and donor atom(s); “2D” for showing the coordination group in 2D generated by LigPlot.
2. The relation of the metal site to the whole metalloprotein. The structure of symmetry-related units displayed by translucent color.
3. The determined shape of the metal site is displayed with the RMSD indicating metal coordination geometry and distortions away from ideality.
4. List of donors. For instance, the metal, Mg (cyan colored), is coordinated with the O atoms from GLU, ATP phosphates and two water molecules, respectively. Among them, two donors from GLU and HOH are located within symmetry-related units. Distance(s) of the donor atom(s) to the metal and the referred B value(s) are displayed.

The screenshot displays the JSmol interface for PDB ID 6AAP. It features four main components:

- 1. Metal Coordination Group (MG):** A 3D ball-and-stick model of the metal site. The metal atom (Mg) is cyan, and donor atoms are shown in various colors. A control panel on the right includes buttons for Donor Atom(s), Angle(s), Distance(s), Reset, Spin On, Spin Off, and 2D.
- 2. Metalloprotein (6AAP):** A 3D ribbon representation of the protein structure. The metal site is highlighted in red. A control panel on the right includes buttons for MG, Donor Atom(s), Cartoon on, Gray, Cell, Reset, Spin On, and Spin Off.
- 3. LigPlot:** A 2D representation of the metal site generated by LigPlot. It shows the metal atom (Mg) coordinated to six donor atoms. The shape is identified as octahedral, with an r.m.s.d. of the angles from ideal octahedral of 6.6°. The donor atoms are labeled: Asp 506(A), Glu 396(A), METAL, and Glu 207(A).
- 4. Donor List:** A table listing the donor atoms and their properties.

Donor:	Residue Name	Distance	B Value
	OE1 GLU A 396	2.112	20.2
	O1B ATP A 504	2.241	19.7
	O1G ATP A 504	2.093	19
	O HOH A 637	2.228	19.7
	OE2 GLU A 207 - from symmetry-related units	2.002	33.2
	O HOH A 716 - from symmetry-related units	2.094	24.5
